

# BRX-XLR-2

## 2-pair Sealed Enclosure

### Quick Start Guide

## Connecting the BRX-XLR-2

### Step 1:

Select the location where the BRX-XLR-2 will be inserted

### Step 2:

Connect the grounding lug of the unit to a proper ground (usually available near a splice point)

### Step 3:

Connect one of the CO pairs to a pair from the DSLAM

### Step 4:

Connect the corresponding CPE pair to the pair going to the subscriber home

**IMPORTANT:** Make sure to match CO pair# to CPE pair#

**NOTE:** After step 4, the DSLAM and the CPE will retrain the circuit and bring up the ADSL2+ / ADSL link with the higher bandwidth.

## Summary Diagram of Typical Installation

**IMPORTANT NOTE:** The BRX-XLR unit is powered from the Sealing Current found on a standard POTS pair. Each pair of the BRX-XLR-2 is powered independently with each pair requiring the presence of the -48Vdc sealing current for proper operation. The BRX-XLR-2 will not operate on a dry pair (line with no -48Vdc sealing current). You can use the Positron BRX Power Injector to provide the -48Vdc sealing current when operating on dry pairs.

## Placement Guidelines for BRX-XLR Devices

The BRX-XLR amplifies ADSL2+ and ADSL loops and is designed to deliver solid amplification of the loops as long as the BRX-XLR device is installed within 45% to 75% of the total loop distance. It is recommended to install the BRX-XLR unit at an existing splice point that is within the recommended placement range. When multiple splice points exist within that range, you should select the one that is most convenient.

The BRX-XLR installation should follow these simple rules:

- L1 - Minimum Loop Length from DSLAM to BRX-XLR** should be no less than 6500 feet (2 km) for 24 AWG (0.5 mm) gauge or 5000 feet (1.5 km) for 26 AWG (0.4 mm) gauge.
- L2 - Minimum Loop Length from CPE to BRX-XLR** should be no less than 650 feet (200 m) for 24 AWG (0.5mm) gauge or 500 feet (150 m) for 26 AWG (0.4 mm) gauge.

For a **10 / 1 Mbps service**, the recommended range is as follows (single pair):

- Maximum total loop length:** 17500 feet (5.3 km) for 24 AWG (0.5mm) gauge or 12750 feet (3.9 km) for 26 WG (0.4 mm) gauge.
- Recommended placement range:** 8000 to 12000 feet (2.4 to 3.6 km) of 24 AWG (0.5mm) gauge or 5700 to 8900 feet (1.7 to 2.7 km) of 26 AWG (0.4 mm) gauge.

The **BRX Cloud Calculator** can help determine the optimal installation location for each specific loop. To access the BRX Cloud Calculator, sign up on the Positron Access Portal at [www.positronaccess.com/Portal.php](http://www.positronaccess.com/Portal.php). You will get a username and password to access the Portal.

## Recommended DSLAM Settings

In order to fully benefit from the amplified ADSL2+ / ADSL signal, there are a few DSLAM settings to be set as per the following recommendation:

Parameter	Downstream	Upstream
Maximum Bitrate	32000 kbps	1296 kbps
Maximum Delay	8 msec	8 msec
Path Latency	Interleaved	
Impulse Noise Protection (INP)	2	1
Target SNR Margin	6.0 dB	6.0 dB

You should also make sure that the DSLAM and/or the BRAS settings are not set at a lower level than the target service offered to the subscriber for this loop.

**NOTE:** You should always follow your corporate guidelines for the DSLAM settings if they differ from the Positron recommendation. If in doubt, you should check with the Engineering or Operation team.
